

Take Home Assignment

People operations data and workflows are spread across spreadsheets, contracts, HR systems, and manual processes, with no reliable source of truth.

Critical information such as compensation, commission plans, offer terms, headcount data, and recruiting metrics is difficult to access and requires manual reconciliation. As a result, reporting is inconsistent, operational workflows are inefficient, and leadership lacks a reliable source of truth across recruiting pipeline health, headcount planning, hiring bottlenecks, and employee trends. Your job is to start fixing that.

Your task is to identify the highest-leverage operational problem in the data provided and build something real to address it.

We are not looking for a slide deck or high-level recommendations. We want to see data modeling, automation logic, dashboards, tooling, or operational workflows that directly solve a problem surfaced in the data.

You have been provided with the following sample data files in a zip file attached to this email:

- recruiting_pipeline.csv – Candidate stages, dates, roles, hiring managers, decisions, and time-in-stage for the past 12 months
- headcount_plan.csv – Approved headcount by department/level, current filled vs. open seats, and target start dates
- offer_log.csv – Offers extended, accepted/declined, comp data, and time-to-close
- people_events.csv – Hires, terminations, and transfers with dates and departments
- offer_letters – sample, redacted offer letters for the past 1 month containing offer-specific terms such as salary, commission structure, equity, start date, location, role, and any special arrangements

Your Task

You'll be given access to Devin for this assignment. Use Devin or your tool of choice to architect, design, and build a lightweight operational system that improves recruiting operations and people-analytics visibility using the provided datasets.

Your project might include:

- Data ingestion and modeling
- Automation of manual workflows
- Dashboards, reporting, and operational insights
- Automation or workflow logic

Deliverables

- Your working project (code or a hosted demo).
- A 45-minute live presentation with members of the team, including: the problem you identified in the data, how you used Devin to scope and build it, the tradeoffs you made, and how it would help operators and leadership
